

SpaceAdventure

Lesson 3

Description

Add a while loop to validate the user input of Y or N.

Welcome to our solar system!
There are 8 planets to explore.
You are currently on Earth, which has a circumference of 24859.82 miles.
What is your name?
Jane
Nice to meet you, Jane. My name is Eliza, I'm an old friend of Siri.
Let's go on an adventure!
Shall I randomly choose a planet for you to visit? (Y or N)
Huh?
Sorry, I didn't get that.
Y
Ok! Traveling to...

Learning Outcomes

- Relate repetitive tasks to Boolean logic and control flow with a `while` loop.
- Practice applying Boolean logic with an expression that uses `not` and `or`.

Vocabulary

input validation	Boolean / logical operator	not
or	loop	while
else if		

Materials

- **SpaceAdventure Lesson 3** Xcode project

Opening

How can we properly handle Y, N and everything else the user might type?

Agenda

- Discuss the need to ask the traveler if he wants to visit a random planet, and to prompt for another answer "as long as the traveler does not answer Y or N."
- Modify the existing user input capturing and decision making to leverage a `while` loop to carry out the repetitive task of waiting for the user to type Y or N.

```
var decision = "" // Start with empty String
while !(decision == "Y" || decision == "N") {
    decision = getln()
    if decision == "Y" {
        println("Ok! Traveling to...")
        // TODO: travel to random planet
    } else if decision == "N" {
        println("Ok, name the planet you would like to visit...")
        // TODO: let the user select a planet to visit
    } else {
        println("Sorry, I didn't get that.")
    }
}
```

- Explain `while` loop syntax, the `!` operator for logical negation, parenthesis for grouping expressions, and the `||` operator.
- Discuss why `decision` is now a variable, as it may be assigned different values during repetitions of the loop.
- Discuss the `if` statement, the `else if` clause and the `else` clause.
- Run the program (⌘R), interact with the console (⇧⌘C), try some arbitrary input, and observe that the program continues to prompt until Y or N is entered.

Closing

Read the code aloud as if it were a story. It seems to be about `println`, `getln` and loops. How can we introduce the concept of an "adventure" into our program?

Modifications and Extensions

- Add an "easter egg" to the program, so that when the user types something like `Cookies!` instead of Y or N, the program responds accordingly.
